

chapter 7

design rules

design rules

Designing for maximum usability
– the goal of interaction design

- Principles of usability
 - general understanding
- Standards and guidelines
 - direction for design
- Design patterns
 - capture and reuse design knowledge

types of design rules

- principles
 - abstract design rules
 - low authority
 - high generality
- standards
 - specific design rules
 - high authority
 - limited application
- guidelines
 - lower authority
 - more general application

Principles to support usability

Learnability

the ease with which new users can begin effective interaction and achieve maximal performance

Flexibility

the multiplicity of ways the user and system exchange information

Robustness

the level of support provided the user in determining successful achievement and assessment of goal-directed behaviour

Principles of learnability

Predictability – users don't like surprises (with exceptions like games)

- determining effect of future actions based on past interaction history
- operation visibility

Synthesizability – requires user to have a mental model (chap 1)

- assessing the effect of past actions
- immediate vs. eventual honesty – changing wysisyg doc vrs updating web pages

Familiarity

- how prior knowledge applies to new system
- guessability; affordance

Generalizability

- extending specific interaction knowledge to new situations

Consistency

- likeness in input/output behaviour arising from similar situations or task objectives

5

Principles of flexibility

Dialogue initiative – system and users in a conversation

- freedom from system imposed constraints on input dialogue
- system vs. user pre-emptiveness
- understanding of main use-cases

Multithreading

- ability of system to support user interaction for more than one task at a time
- concurrent vs. interleaving
- multimodality – button click / alt + / menu item

Task migratability

- passing responsibility for task execution between user and system
- ultimate user control

Substitutivity

- allowing equivalent values of input and output to be substituted for each other
- representation multiplicity (graph/values)
- equal opportunity (define line by drawing or specifying length/position)

Customizability

- modifiability of the user interface by user (adaptability) or system (adaptivity)

6

Principles of robustness

Observability

- ability of user to evaluate the internal state of the system from its perceivable representation
- browsability; defaults; reachability; persistence; operation visibility

Recoverability

- ability of user to take corrective action once an error has been recognized
- reachability; forward/backward recovery; commensurate effort

Responsiveness

- how the user perceives the rate of communication with the system
- Stability

Task conformance

- degree to which system services support all of the user's tasks
- task completeness; task adequacy

7

Standards

- set by national or international bodies to ensure compliance by a large community of designers standards require sound underlying theory and slowly changing technology
 - many large organisations have their own standards
- hardware standards more common than software high authority and low level of detail
- ISO 9241 defines usability as effectiveness, efficiency and satisfaction with which users accomplish tasks

8

Guidelines

- more suggestive and general
- many textbooks and reports full of guidelines
- abstract guidelines (principles) applicable during early life cycle activities
- detailed guidelines (style guides) applicable during later life cycle activities
- understanding justification for guidelines aids in resolving conflicts

9

Golden rules and heuristics

- “Broad brush” design rules
- Useful check list for good design
- Better design using these than using nothing!
- Different collections e.g.
 - Nielsen’s 10 Heuristics (see Chapter 9)
 - Shneiderman’s 8 Golden Rules
 - Norman’s 7 Principles

10

Nielsen’s 10 Usability Heuristics

1. *Visibility of system status*
2. *Match between system and the real world*
3. *User control and freedom*
4. *Consistency and standards*
5. *Error prevention*
6. *Recognition rather than recall*
7. *Flexibility and efficiency of use*
8. *Aesthetic and minimalist design*
9. *Help users recognize, diagnose, and recover from errors*
10. *Help and documentation*

11

Shneiderman’s 8 Golden Rules

1. *Strive for consistency*
2. *Enable frequent users to use shortcuts*
3. *Offer informative feedback*
4. *Design dialogs to yield closure*
5. *Offer error prevention and simple error handling*
6. *Permit easy reversal of actions*
7. *Support internal locus of control*
8. *Reduce short-term memory load*

12

Norman's 7 Principles

1. Use both knowledge in the world and knowledge in the head.
2. Simplify the structure of tasks.
3. Make things visible: bridge the gulfs of Execution and Evaluation.
4. Get the mappings right.
5. Exploit the power of constraints, both natural and artificial.
6. Design for error.
7. When all else fails, standardize.

13

HCI design patterns

- An approach to reusing knowledge about successful design solutions
- Originated in architecture: Alexander
- A pattern is an invariant solution to a recurrent problem within a specific context.
- Examples
 - Light on Two Sides of Every Room (architecture)
 - Go back to a safe place (HCI)
- Patterns do not exist in isolation but are linked to other patterns in *languages* which enable complete designs to be generated

14

HCI design patterns (cont.)

- Characteristics of patterns
 - capture design practice not theory
 - capture the essential common properties of good examples of design
 - represent design knowledge at varying levels: social, organisational, conceptual, detailed
 - embody values and can express what is humane in interface design
 - are intuitive and readable and can therefore be used for communication between all stakeholders
 - a pattern language should be generative and assist in the development of complete designs.

15

Summary & Exercise

Exercise

- Match Nielsen/ Shneiderman/Norman lists to earlier principles

Principles for usability

- repeatable design for usability relies on maximizing benefit of one good design by abstracting out the general properties which can direct purposeful design
- The success of designing for usability requires both creative insight (new paradigms) and purposeful principled practice

Using design rules

- standards and guidelines to direct design activity

16
